PROFESSIONAL SUMMARY

Management Information Systems (MIS) and Data Analytics professional with 14 years of Telecom experience, now transitioning into AI Automation and Workflow Engineering. Over the past two years I have self-trained intensively in this field and built hands-on, self-initiated projects — AI Agents, AI chatbots, and multi-step n8n and Make workflows that connect CRMs, databases, and business tools through REST APIs and webhooks to automate lead management, customer support, reporting, and content operations. Comfortable working with OpenAI, Claude, and Gemini APIs, prompt engineering, Airtable data models, error handling, and workflow documentation, and continuing to deepen these skills through practical builds. My MIS background brings genuine strength in process mapping, data quality, and business reporting — understanding which process is worth automating and how to measure the result. Seeking my first professional role in AI Automation and Workflow Engineering, where I can apply this hands-on project experience and grow quickly within a team.

PROFESSIONAL EXPERIENCE

AI Automation & Workflow Engineer — Independent Practice

2024 – Present

- Design and build hands-on AI automation workflows using n8n and Make, integrating CRMs, databases, email, messaging, and web applications.
- Develop AI Agents and AI chatbots on OpenAI, Claude, and Gemini APIs, applying prompt engineering, tool calling, and structured JSON outputs to automate lead qualification, customer support, and business research.
- Integrate systems through REST APIs and webhooks with API authentication, data mapping, pagination, and JSON/data transformation between services.
- Build knowledge-base-driven AI agents and RAG pipelines using structured data sources such as Airtable and Supabase, along with embeddings and Postgres/pgvector vector databases, to keep responses grounded in business-specific information.
- Engineer reliability with error handling, retries, conditional branching, deduplication, validation, and logging, plus Telegram failure alerts for visibility.

- Design human-in-the-loop approval steps (inline Telegram approval cards) so AI-drafted actions are reviewed before anything is sent.
- Map and re-engineer manual business processes before automating, identifying the highest-effort, highest-error steps and replacing them with automated, auditable flows.
- Document workflows and hand over operating instructions so business users can run, monitor, and extend the automations independently.

MIS & Data Analytics Executive

2012 – Present (14 Years)

Leading Telecom Organization

- Deliver executive MIS and KPI reporting across business units, managing and validating large volumes of operational data.
- Automate recurring reporting cycles using Excel VBA and advanced formulas, significantly reducing manual effort and improving accuracy.
- Build interactive Power BI and Advanced Excel dashboards using AI-assisted formula and VBA generation with Claude in Excel and Microsoft Copilot, supporting operations and leadership decision-making.
- Cut substantial time out of manual Excel work by using Claude in Excel and Microsoft Copilot to generate formulas, VBA macros, and data transformations that previously took hours to build by hand.
- Drive process optimisation and data-quality standards in partnership with operations teams.

SKILLS & TECHNICAL EXPERTISE

Core Focus: AI Automation, Workflow Engineering, Business Process Automation, Process Mapping, CRM Automation, Data Analytics, MIS Reporting

Automation Platforms: n8n, Make.com, Zapier

AI & LLMs: OpenAI API, Claude, Gemini, AI Agents, AI Chatbots, Tool Calling, Prompt Engineering, Structured JSON Outputs, RAG / Knowledge Bases

APIs & Integration: REST APIs, Webhooks, JSON, API Authentication (API keys / OAuth), Data Mapping & Transformation, Pagination

Workflow Engineering: Error Handling & Retries, Conditional Branching, Deduplication & Validation, Human-in-the-Loop Approval, Scheduling & Triggers, Multi-Tenancy & Session Isolation, Logging & Alerting

Databases: MySQL (self-taught), Postgres/pgvector, Supabase, Airtable

Data & Business Tools: Google Sheets, Gmail API, Telegram Bot API, WhatsApp Business API, WordPress, GitHub

Analytics & Reporting: Power BI, Advanced Excel, VBA, Power Pivot, Pivot Tables

AI in Excel & Reporting: Claude in Excel, Microsoft Copilot — AI-assisted data analysis, formula generation & optimisation, VBA development & debugging, data cleaning & validation, dashboard development, MIS/KPI insight generation

KEY PROJECTS

CRM AI Agent

Objective: Built a two-agent CRM automation with autonomous decision-making. A daily outreach agent pulls new and follow-up-due leads from Airtable, researches each company (website scrape, Google Search, Google Maps/reviews), and independently decides whether to send a personalised cold email or skip a low-confidence lead — updating Airtable either way. A second agent checks Gmail every four hours for replies, reads each one for actual intent rather than keyword-matching, and either responds autonomously (positive/ambiguous replies) or escalates to a human via Telegram for anything requiring judgment — pricing questions, meeting requests, or technical questions. Technologies: n8n, LLM tool-calling agents, Airtable, Gmail API, Google Search / Maps, web scraping, Telegram Bot API. Business Impact: Both agents share the same escalation tool and update lead status, notes, and follow-up dates in Airtable after every action, so the lead lifecycle runs end to end with human input only where judgment is genuinely needed.

Enterprise Knowledge Base RAG & AI Support Agent

Objective: Built a two-workflow RAG system — an ingestion pipeline that chunks, embeds, and stores company documents in a Postgres vector database with document-level idempotency (skipping re-ingestion of unchanged document versions), and a question-answering pipeline that retrieves the top-K relevant chunks, validates retrieval sufficiency before generating an answer, and produces responses grounded strictly in retrieved context. Technologies: n8n, embeddings, Postgres vector store (pgvector), LLM APIs, Telegram Bot API. Business Impact: Answers stay grounded in real company documentation, with a hard fallback to human escalation via Telegram when the knowledge base does not cover a question rather than letting the model guess.

AI Lead Generation Automation

Objective: Built a B2B lead qualification engine that scans five public signal sources — job boards (Arbeithnow, Jobicy, RemoteOK) and Hacker News discussions — for businesses showing real operational automation pain. A keyword pre-filter runs before any AI call, then a two-stage Gemini

pipeline qualifies each lead: a primary model scores it against a 7-factor, 100-point rubric and drafts outreach copy, and a second, independent "skeptical auditor" model is prompted to disprove that verdict and can veto it outright. Technologies: n8n, Gemini API, multi-stage LLM evaluation, REST APIs, Airtable. Business Impact: Only leads surviving both AI passes are enriched and written to the CRM — deduplicated against enterprise domains and existing records — cutting false positives before they ever reach a human.

AI Email Classification & Auto-Reply Workflow

Objective: Built an AI email triage system that classifies every incoming email into three tiers — promotional (auto-archived silently), important (Telegram FYI, no action needed), or needs-reply (drafted and routed for approval) — using a Gemini agent constrained to strict JSON output. Replies are sent as an inline-button Telegram approval card, where a single tap dispatches the AI-drafted reply via Gmail with a fixed, code-appended signature to eliminate hallucination risk, or discards it, updating the original message and Gmail thread either way. Technologies: n8n, Gemini API, structured JSON output, Gmail API, Telegram Bot API. Business Impact: Removes inbox triage entirely while keeping a human decision point on every email that genuinely needs one.

Multi-Tenant WhatsApp AI Agent

Objective: Built a multi-tenant n8n workflow designed to support multiple WhatsApp clients without separate workflow deployments. Incoming messages are resolved to a specific client by the receiving WhatsApp number, dynamically pulling that client's system prompt and knowledge base from Supabase at runtime. A Gemini agent answers strictly from the client's own data — explicitly instructed to admit uncertainty and hand off to a human rather than invent answers. Technologies: n8n, Gemini API, Supabase, WhatsApp Business API. Business Impact: A composite session key (client + customer) keeps conversation memory fully isolated per tenant, preventing cross-client context leakage while scaling to new clients through configuration alone.

CERTIFICATIONS

AI Automation Engineer with n8n • Generative AI Foundations • Google AI Essentials • Microsoft Power BI • Advanced MS Excel • Excel VBA & Macros • Data Analytics

EDUCATION

B.A. and Post Graduate Diploma in Computer Application — Guwahati University 2012

LANGUAGES

English • Hindi • Assamese
